

E-Commerce Product Management System Implementation Report

Name: Shreyas M V

USN: 21SECD41

Course: Full Stack Development

1. Introduction

This report details the step-by-step implementation of an E-Commerce Product Management System using Django.

The system allows managing product listings and categories via the Django Admin interface and displays products using Django's ListView.

Additionally, a database migration was performed to introduce a discount field after initial development.

2. Step-by-Step Implementation

2.1 Setting Up Django Project and App

1. Install Django:

```
pip install django
```

2. Create a new Django project and app: `django-admin`

```
startproject ecommerce cd ecommerce django-admin
```

```
startapp products
```

2.2 Define Models

```
from django.db import models
```

```
class Category(models.Model):    name =  
models.CharField(max_length=255, unique=True)
```

```
    def __str__(self):  
return self.name
```

```
class Product(models.Model):  
    name = models.CharField(max_length=255)    description =  
models.TextField()    price =
```

```
models.DecimalField(max_digits=10, decimal_places=2)        stock =
models.PositiveIntegerField()

    category = models.ForeignKey(Category, on_delete=models.CASCADE,
related_name="products")

    def __str__(self):

        return self.name
```

2.3 Register Models in Django Admin

```
from django.contrib import admin from
.models import Product, Category

@admin.register(Product) class
ProductAdmin(admin.ModelAdmin):
    list_display = ('name', 'price', 'stock', 'category')
search_fields = ('name', 'category__name')
list_filter = ('category',)

@admin.register(Category) class
CategoryAdmin(admin.ModelAdmin):
list_display = ('name',)
```

2.4 Apply Migrations

```
python manage.py makemigrations
python manage.py migrate
```

2.5 Implement Product List View

```
from django.views.generic import ListView
from .models import Product

class ProductListView(ListView):
    model = Product        template_name =
"products/product_list.html"
context_object_name = "products"
```

2.6 Configure URL Patterns

```
from django.urls import path from
.views import ProductListView

urlpatterns = [
    path('products/', ProductListView.as_view(),
name='product-list'), ]
```

2.7 Add Discount Field via Migrations

```
class Product(models.Model):

    name = models.CharField(max_length=255)    description =
models.TextField()    price =
models.DecimalField(max_digits=10, decimal_places=2)    stock =
models.PositiveIntegerField()

    category = models.ForeignKey(Category, on_delete=models.CASCADE,
related_name="products")    discount = models.DecimalField(max_digits=5, decimal_places=2,
default=0.00)    # New Field
```

2.8 Run the Server and View Products

```
python manage.py runserver
```
